

2. Create a web page for user profile and execute a PHP file on submission of the form and display the information using PHP.

How it works

1. User opens **user_profile.html**
2. Fills the form and clicks **Submit**
3. Data is sent to **display_profile.php**
4. PHP fetches the data using `$_POST` and displays it

1. user_profile.html (Form Page)

Save this file as **user_profile.html**

```
<!DOCTYPE html>
<html>
<head>
    <title>User Profile Form</title>
</head>
<body>

<h2>User Profile</h2>

<form action="display_profile.php" method="post">
    <label>Name:</label><br>
    <input type="text" name="name" required><br><br>

    <label>Email:</label><br>
    <input type="email" name="email" required><br><br>

    <label>Age:</label><br>
    <input type="number" name="age" required><br><br>

    <label>Gender:</label><br>
    <input type="radio" name="gender" value="Male" required> Male
    <input type="radio" name="gender" value="Female" required> Female
    <input type="radio" name="gender" value="Other" required> Other<br><br>

    <label>Address:</label><br>
    <textarea name="address" rows="3" required></textarea><br><br>

    <input type="submit" value="Submit">
</form>
```

```
</body>
</html>
```

✓ 2. display_profile.php (PHP File to Display Data)

Create this file in the same folder:

```
<?php
// Fetch submitted data
$name = $_POST['name'];
$email = $_POST['email'];
$age = $_POST['age'];
$gender = $_POST['gender'];
$address = $_POST['address'];
?>

<!DOCTYPE html>
<html>
<head>
    <title>User Profile Details</title>
</head>
<body>

<h2>User Profile Information</h2>

<p><strong>Name:</strong> <?php echo $name; ?></p>
<p><strong>Email:</strong> <?php echo $email; ?></p>
<p><strong>Age:</strong> <?php echo $age; ?></p>
<p><strong>Gender:</strong> <?php echo $gender; ?></p>
<p><strong>Address:</strong> <?php echo nl2br($address); ?></p>

</body>
</html>
```
